Subject: Addendum to Report of Sampling and
Analysis of Soil Gas for Methane
Phase 2 Portion of Playa Vista
CDM Project Number 10610-30928.RT.RPT

Dear Mr. Nelson:

This addendum supplements the *Report of Sampling and Analysis of Soil Gas for Methane for the Phase 2 Portion of Playa Vista* dated November 2, 2000. The following analysis summarizes the results of the detailed sampling events within the central portion of Area D. Camp Dresser & McKee Inc. (CDM) observed the collection of soil gas samples from 90 locations within Area D (Phase 2 Portion) of Playa Vista between November 14, and 17, 2000. In accordance with soil gas testing requirements issued on October 11, 2000 by the City of Los Angeles Department of Building and Safety (LADBS) relative to the Second Phase Project EIS/EIR, sampling locations spaced on a 100-foot grid were sited in the vicinity of methane sample locations where concentrations of methane from samples collected from October 2 through October 10, 2000 exceeded 1,000 parts per million by volume (ppmv). Figure 1 shows the sampling locations.

1.0 Sampling and Analyses

Ninety-seven locations were proposed for sampling. A total of 90 samples were collected during this field event. Seven of the proposed locations were not accessible due to surface construction debris or ponded water. The sampling procedures and analysis were identical to those completed during the initial sampling and documented within the November 2, 2000 report.

2.0 Analyses Results

2.1 Light Hydrocarbons

The analytical data for light hydrocarbons are provided in attached Table 1. Laboratory reported data are included in Appendix A. The following tables summarize the maximum and minimum concentrations.

Mr. David Nelson
 May 8, 2001
 Page 2 of 4

Light hydrocarbons in soil gas summary

Statistical Parameter	Light Hydrocarbon statistics [all measurements in parts per million per volume (ppmv)]						
	Methane	Ethane	Ethylene	Propane	Propylene	i-Butane	n-Butane
Frequency of detection	100%	100%	94%	96%	81%	44%	47%
Minimum	1.24	0.03	<0.01	<0.03	<0.03	<0.03	<0.03
Maximum	306,000	2111.0	1.90	3.53	2.70	2.68	1.27

Maximum and minimum detection locations by sample number

Locations with:	Methane	Ethane	Ethylene	Propane	Propylene	i-Butane	n-Butane
Minimum value	9704	9742, 9747	9724, 9726, 9731, 9735, 9742	9742, 9747, 9761, 9765,	9712, 9713, 9716, 9724, 9726, 9731, 9733, 9735, 9742, 9747, 9761, 9765, 9766, 9776, 9781, 9788, 9794	50 locations	48 locations
Maximum value	9726	9724	9708	9724	9730	9724	9779

With the exception of methane and a few of the detections of ethane, ethylene, and propane, nearly all C1-C4 compound concentrations were below 1 ppmv for all samples.

Shallow soil gas methane concentrations ranged from 1.24 ppmv in sample 9704 to 300,600 ppmv in sample 9726. The mean methane concentration of all samples was 11,540 ppmv. However, the median methane concentration of all samples was 16.5 ppmv. This indicates that most of the detections were well below 100 ppmv, but that the data included a few relatively large detections accounting for the larger mean.

Five of the 90 soil gas samples had methane concentrations greater than the lower explosive limit of 5% by volume (i.e., greater than 50,000 ppmv). The five samples were from locations 9724, 9726, 9731, 9735, and 9737. These samples were collected in the south central part of Area D (Figure 1). Methane concentrations in these samples, which were the highest of all the samples taken, ranged from 78,200 ppmv to 306,000 ppmv. The sampling locations are adjacent to each other, and constitute the area of Playa Vista having soil gas with the highest methane concentration measured during this sampling event. Nearby samples contain methane concentrations ranging from 1.24 ppmv to

Mr. David Nelson
May 8, 2001
Page 3 of 4

19,900 ppmv. Methane concentrations drop off rapidly to the northeast and slightly less rapidly to the north and east.

Ethane concentrations ranged from 0.03 ppmv at two locations to 2111 ppmv at sample location 9724. Most ethane detections were below 1 ppmv. The few higher detections are associated with samples having high methane concentrations. Ethylene concentrations ranged from non-detect at <0.01 ppmv at five locations to 1.90 ppmv at sample location 9708. Eighty-four samples contained ethylene concentration detections below 0.50 ppmv. Higher ethylene detections were generally associated with samples having high concentrations of methane. However, sample 9726, which had the highest methane concentration of all samples tested had no detection of ethylene at <0.01 ppmv.

Propane, propylene, isobutane, and n-butane concentrations ranged from non-detect at <0.03 ppmv to 3.53 ppmv, 2.70 ppmv, 2.68 ppmv, and 1.27 ppmv, respectively. Concentrations for each of these gases were well below 1 ppmv in nearly all samples where the gases were detected.

2.2 *Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX)*

Benzene, toluene, ethylbenzene, and xylene (BTEX) were analyzed at the 90 sampling locations. The laboratory-reporting limit for all BTEX compounds was 0.07 ppmv . The laboratory report summarizing the analytical data is provided in Appendix A.

Benzene analyses results ranged from non-detect to 0.09 ppmv in sample 9725, which was the only detectable concentration out of all samples taken. Toluene was detected in four of the soil gas samples, with the highest detection at 0.32 ppmv in sample 9736. Ethyl benzene was detected in 13 samples with a maximum concentration of 0.41 ppmv at location 9715. Total xylenes were detected in 16 samples with a maximum detection of 0.48 ppmv in sample 9715.

2.3 *Hydrogen Sulfide*

Hydrogen sulfide concentrations were measured using a Jerome 631-X hydrogen sulfide analyzer. The results of the measurements are summarized on Table 2. The instrument detection range is between 0.003 ppm and 50 ppm. The instrument can report concentrations at 0.001 ppm and 0.002 ppm, however, according to the manufacturer, these concentrations are below the range of instrument accuracy. Concentrations at many of the sampling locations were reported by the instrument at 0.001 ppm and 0.002 ppm and are considered estimated.

Hydrogen sulfide was detected at 0.003 ppmv or greater in 37 of the 90 samples (41 percent) tested. As such, 59 percent of the samples tested had hydrogen sulfide levels of less than 0.003 ppmv. The highest hydrogen sulfide concentration was above 50 ppmv (the upper instrumentation detection limit) at location 9735. The second highest

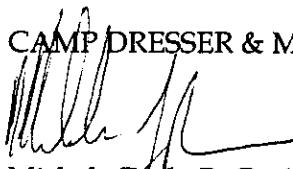

Mr. David Nelson
May 8, 2001
Page 4 of 4

hydrogen sulfide concentration was recorded at location 9724 and was only 1.0 ppm or less. Concentrations of hydrogen sulfide within samples collected surrounding 9735 are low to non-detect, suggesting that the elevated concentration is anomalous. The remaining 36 samples ranged between 0.003 and 1.0 ppmv.

Should you have any questions regarding the testing results summarized above or the attached supporting data, please contact either of us at (949) 752-5452.

Sincerely,

CAMP DRESSER & McKEE INC.

Irvine, CA 92612

Dear Ms. Zych:

Attached is the final data listing for the sample(s) we received on November 15, 2000, your project: PLAYA VISTA.

Please give me a call if you have questions or I can be of further assistance. Thank you for using Microseeps.

Sincerely,

Rebecca J. Hans

RJH/lsp

18881 Von Karman
Suite 650
Irvine, CA 92612

Dear Ms. Zych:

Attached is the final data listing for the sample(s) we received on November 16, 2000, your project: PLAYA VISTA.

Please give me a call if you have questions or I can be of further assistance. Thank you for using Microseeps.

Sincerely,

Rebecca J. Hans

Dear Ms. Zych:

Attached is the final data listing for the sample(s) we received on November 16, 2000, your project: PLAYA VISTA.

Please give me a call if you have questions or I can be of further assistance. Thank you for using Microseeps.

Sincerely,

Rebecca J. Hans
